

## Your Security Is Our Concern!

Did you know that over a normal wireless connection that anyone who can receive your signal can also eavesdrop / spy on you? It's the very nature of any wireless communication (open air) that causes this. Unlike wires in the ground, you cannot physically secure the air that we breathe or the radio waves that pass all around us.

At MSWorldNet, your security and privacy are our concern. That's why when we setup your connection, we setup a mandatory encrypted channel (similar to those used by corporate America) between your home and our network, to keep prying eyes away. This is all handled transparently through our antennas, which we've custom built to provide the level of service you deserve.

(Note: Once your traffic leaves the MSWorldNet network, it may or may not be encrypted depending on what type of information / services you are using).

### **Built-In NAT Protection / Use Multiple Computers.**

We realize that many people have more than one computer. Rather than making you pay extra money for each computer, or forcing you to try to sneak multiple computer by using a NAT router (which you would have to purchase), we've integrated a NAT router into our antennas. You can connect up to 253 computers in your home or office.

As an added bonus, a NAT router provides some rudimentary firewall protection for your home network.

### **If you are interested in wireless internet please call 345-2391 and arrange a Free Site Survey.**

During your site survey we will determine if Wireless Access is appropriate for your location by doing the following.

- \* Check for clear line of site to tower from transceiver mounting position
- \* Check for appropriate mounting position of antenna
- \* Test for signal strength
- \* Check to see if you have appropriate equipment to utilize the service

We will assess what is needed to provide the service you require. If additional equipment or service is required we will give a written estimate

## High-Speed Wireless

Living in the country or outside of a major metropolitan area has typically meant no high-speed Internet. In those remote areas where high-speed Internet was available...prices were inflated and service unreliable. But no longer! MSWorldNet is actively expanding and deploying wireless Network to the outlying communities around the Arnott, Plover and Stockton areas. We're bridging the "last-mile" and bringing affordable high-speed Internet access to everyone!
